[AG PUR (1/2023)]

BACKGROUND

California began requiring limited pesticide use reporting in 1934. However, the detailed reporting that occurs today did not begin until the 1990s. The Food Safety Act of 1989 gave the California Department of Pesticide Regulation (DPR) the authority to require broader reporting of agricultural pesticide use. Comprehensive use reporting including the pesticide applied, amount applied, area treated, application method, and other details began in 1990.

Over the years, this data has been used by a variety of individuals and groups, including government officials, legislators, scientists, growers, and public interest groups. On average, DPR collects around three million pesticide use records a year.

Currently the Pesticide Use Reporting (PUR) database contains over 97 million pesticide use records, going back to 1990.

PESTICIDE USE OVERVIEW

Reported pesticide use in California in 2021 totaled 191 million pounds of applied active ingredients (AIs) and 95 million cumulative acres treated. Compared to 2020, pounds of applied AIs decreased by 24.8 million (-11.5 percent), and cumulative acres treated decreased by 10.9 million (-10.3 percent).

Following are the top five AIs as measured by pounds applied and cumulative acres treated. AIs are listed in descending order.

Highest Pounds Applied	Highest Cumulative Acres Treated
Sulfur	Sulfur
Petroleum and mineral oils	Glyphosate
1,3-Dichloropropene	Petroleum and mineral oils
Glyphosate	Abamectin
Metam-potassium	Lambda-cyhalothrin

DEFINITIONS

Cumulative Acres Treated

The cumulative acres treated for a crop may be greater than the planted area of the crop since this measure accounts for a field being treated with the same active ingredient (AI) more than once in a year. For example, if a 20-acre field is treated three times in a calendar year with an AI, the cumulative acres treated would be reported as 60 acres while the area planted would be reported as 20 acres.

Pounds Applied

Total pounds of AI summed over a given time period, geographic area, crop, or other unit of interest.

COMMODITIES OF INTEREST

Every year, DPR identifies use trends of commodities that were treated with over four million pounds of AIs or had more than three million cumulative acres treated. We refer to these as commodities of interest.

Collectively, the pesticides used on the 2021 commodities of interest represent 72 percent of the total amount applied and 76 percent of the cumulative acres treated in 2021.

More detailed use trends for commodities of interest are discussed in the full 2021 PUR Annual Report.

2021 Commodities of Interest:

- Alfalfa
- Almond
- Carrot
- Cotton
- Orange and Tangerine
- Peach and Nectarine
- Pistachio
- Processing Tomato
- Rice
- Strawberry
- Table and Raisin Grape
- Walnut
- Wine Grape

KEY PESTICIDE AND COMMODITY TRENDS

Pesticide use is affected by many factors, including pest populations/outbreaks, adoption of integrated pest management practices, crop value, weather, availability of water, cost of pesticides and labor, pesticide resistance and effectiveness, and more.

Crops treated with the most total pounds of pesticides in 2021 were almond, wine grape, orange and tangerine, strawberry, and table and raisin grape. Crops that increased most in pounds applied from 2020 to 2021 were strawberry and tangerine. Crops that decreased most in pounds applied were almond, wine grape, table and raisin grape, and walnut.

Sulfur was the top AI in terms of pounds applied and acres treated in 2021. Sulfur is a low-toxicity, natural fungicide and miticide and is used on each of the 2021 commodities of interest. It is used by both conventional and organic farmers to manage powdery mildew, mites, and other pests.

PESTICIDE CATEGORIES OF INTEREST

Pesticide use is summarized for eight different categories based on a pesticide's potential to cause health or environmental impacts or type of pesticide. The following table lists these categories and shows their use trends in 2021 versus 2020. Lower-toxicity pesticides (biopesticides and oils) are listed at the top of the table above the thicker dividing line.

Category	Change in Pounds Applied	Percent Change Pounds	Change in Acres Treated	Percent Change Acres
Biopesticides	↓ -1,001,356	-12	↓ -607,435	-7
Oils	↓ -6,720,312	-15	↓ -646,897	-11
Carcinogens	↓ -4,933,941	-12	↓ -1,499,627	-18
Cholinesterase Inhibitors	↓ -530,238	-18	↓ -411,996	-17
Fumigants	↓ -1,590,908	-4	↓ -30,537	-12
Ground Water Contaminants	↓ -74,764	-26	↓ -98,413	-30
Reproductive Toxins	↓ -1,049,689	-14	↓ -306,435	-8
Toxic Air Contaminants	↓ -2,271,512	-5	↓ -346,315	-16

TEN-YEAR USE TRENDS

DPR’s Pesticide Use Annual Report includes both short-term and long-term pesticide use trends. Use changes from one year to the next reflect short-term variability in pesticide use. Pesticide use is dependent on many factors that can vary unpredictably year over year, including drought conditions, weather, crop selection and other variables. DPR monitors pesticide use data for longer-term trends to inform actions to mitigate potential impacts to human health and the environment and to inform California’s transition to safer, more sustainable pest management. The graphic below highlights the 10-year trend line between 2012 and 2021.

Category	Change in Pounds Applied	Percent Change Pounds	Change in Acres Treated	Percent Change Acres
Biopesticides	 3,331,017	77	 2,849,208	51
Oils	 8,924,618	31	 894,606	22
Carcinogens	 -7,711,013	-17	 -2,510,038	-27
Cholinesterase Inhibitors	 -1,601,732	-40	 -1,657,085	-46
Fumigants	 -8,190,384	-18	 -192,949	-47
Ground Water Contaminants	 -878,001	-81	 -632,653	-74
Reproductive Toxins	 -8,810,333	-58	 -1,649,250	-32
Toxic Air Contaminants	 -11,110,820	-22	 -1,765,249	-49

The causal factors driving use trends are numerous and are often specific to different regions, pests, or crops/sites, and are not evaluated in this report.
