CORRELATING AGRICULTURAL USE WITH AMBIENT AIR CONCENTRATIONS OF CHLORTHAL-DIMETHYL DURING THE PERIOD OF 2011 – 2014

Kenneth D. King

February 17, 2016

Abstract

In February of 2011, the California Department of Pesticide Regulation began operation of the Air Monitoring Network (AMN) to meet its mandate to continuously evaluate currently registered pesticides. The AMN collected a 24-hour sample each week to measure airborne concentrations of 37 chemicals including chlorthal-dimethyl in three California communities (Shafter, Ripon, and Salinas) from 2011 to 2014. In addition, DPR collected pesticide use information through its Pesticide Use Reporting (PUR) database for the same time period. The goal of this report was to examine the relationship between reported agricultural use and detected concentrations of chlorthal-dimethyl in these communities during the period from February 1, 2011, to December 31, 2014.

Due to a low number of detections and to low reported use of chlorthal-dimethyl within 5 miles surrounding the three AMN sampling locations, any statistical analysis of local chlorthal-dimethyl use and ambient chlorthal-dimethyl concentrations was not feasible. A total of one quantifiable detection of chlorthal-dimethyl was measured from any of the AMN locations between February 1, 2011, and December 31, 2014. All detections, including trace and quantifiable concentrations, were well below their respective screening levels.

1. Introduction

Chlorthal-dimethyl (DCPA or dacthal) is an herbicide used for the pre-emergent control of annual grasses and broadleaf weeds. Chlorthal-dimethyl was first registered under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) in 1958 for the pre-emergence control of crabgrass. Chlorthal-dimethyl ranked 86th by pounds of active ingredient (AI) used in the state of California in 2013 (DPR, 2015c). Use in California has remained fairly consistent since 2001 when the product was registered and production relaunched upon acquisition by AMVAC after being discontinued in 1997 by ISK for economic reasons (Dainello, 2001).

In February of 2011, the California Department of Pesticide Regulation (DPR) began operation of its year-round Air Monitoring Network (AMN). Ambient concentrations of chlorthal-dimethyl are monitored as one of the 37 chemicals included in the AMN. This monitoring takes place in three California communities: Ripon, Salinas, and Shafter. One of the initial objectives of the AMN was to compare air concentrations of measured pesticides with use records. This report looks into the relationship between AMN measured ambient chlorthal-dimethyl concentrations with chlorthal-dimethyl applications made within five miles of the three AMN monitoring locations during the period from February 1, 2011, to December 31, 2014.

2. Chemical Description

Technical grade chlorthal-dimethyl is crystalline in structure with a melting point of 156°C (Shaner, 2014). The vapor pressure of chlorthal-dimethyl is such that it may exist in either the vapor or particulate phase in the atmosphere (Bidleman, 1988). There is currently only one product with an active DPR registration: Dacthal Flowable Herbicide (Dacthal W-75 was discontinued on 12/31/2015). Dacthal Flowable Herbicide is formulated as flowable concentrate with 54.9% AI (DPR, 2001; DPR, 2003).

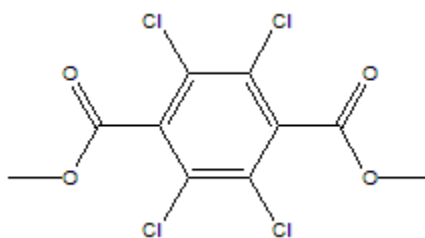

Figure 1 – Chemical structure of chlorthal-dimethyl

Table 1 - Physical & chemical properties of chlorthal-dimethyl	
Common Names	Dacthal, DCPA, Chlorthal-dimethyl
Chemical Name	Dimethyl tetrachloroterephthalate
Other Names	DAC 893, dimethyl 2,3,5,6-tetrachloro-1,4-
CAS Number	1861-32-1
Chemical Family	Phthalates
Empirical Formula	C ₁₀ H ₆ Cl ₄ O ₄
Molecular Mass	331.97 g/mol
Physical Form	Technical Grade DCPA is crystalline
Melting Point	156°C
Boiling Point	N/A (<i>decomposes at 360-370°C</i>)
Water Solubility	0.5 mg/L at 25°C
Vapor Pressure	3.33 x 10 ⁻⁴ Pa at 25°C
Henry's Law Constant	2.18 x10 ⁻⁶ atm-cu m/mol at 25°C
log K _{ow}	4.40
K _{oc}	5000 mL/g (average)

3. Environmental Persistence

Volatilization has been previously shown to account for the majority (36-53%) of chlorthal-dimethyl loss following agricultural applications (Majewski *et al.*, 1991). Once in the atmosphere and due to its high vapor pressure, chlorthal-dimethyl can exist in either the gas or particulate phase (Bidleman, 1988). Chlorthal-dimethyl in the vapor phase is subject to slow breakdown by hydroxyl radicals and its atmospheric half-life is estimated to be 36 days (Meylan and Howard, 1993). Products from the photodecomposition of chlorthal-dimethyl included monomethyl tetrachloroterephthalic acid (MTP), tetrachloroterephthalic acid (TPA), and 1,2,4,5 tetrachlorobenzene (NIH, 2006).

Chlorthal-dimethyl is essentially immobile in soil, as it strongly binds with organic matter or clay (Swann *et al.*, 1983; Choi *et al.*, 1988). Chlorthal-dimethyl has been shown to follow a first order dissipation rate with a calculated half-life in soil of 33.8 days (Majewski *et al.*, 1991). An estimated 10% of applied chlorthal-dimethyl was lost to volatilization within 21 days of application in one experiment (CDFA, 1989). Photodegradation may occur on the soil surface, resulting in the same products listed above (NIH, 2006). The Henry's Law constant for chlorthal-dimethyl indicates that volatilization from water will be slow (Lyman *et al.*, 1990).

4. Regulation and Human Health Effects

Chlorthal-dimethyl was first registered in the United States (US) in 1958 under FIFRA for the selective pre-emergence control of crabgrass and other weeds in/on/for turf grasses. The US Environmental Protection Agency (EPA) issued a registration standard in 1988 and completed a reregistration eligibility decision in 1995 (US EPA, 1998).

The USEPA Office of Pesticide Programs (OPP) recognizes chlorthal-dimethyl as a group C (possible human) carcinogen (USEPA, 2006). Additionally, chlorthal-dimethyl is known to contain <0.3% hexachlorobenzene which is a group B2 (probable human) carcinogen (Tobin, 1985; USEPA, 2000). While chlorthal-dimethyl is not on California's Proposition 65 list, this impurity is listed for both cancer and developmental toxicity (OEHHA, 2015).

Since 1971, DPR has monitored reports submitted by physicians of incidents of illness through known or suspected exposures to pesticides within California through its Pesticide Illness Surveillance Program (DPR, 2015b). Seven incidents involving chlorthal-dimethyl among other pesticides have been reported, most recently in 2008 (DPR, 2015a). All incidents involved occupational exposures of either field workers or applicators (DPR, 2015a). Four of the incidents were described as exposure via residue, two by drift, and one unknown (DPR, 2015a). None of these reported occupational exposures were fatal; the most common symptoms reported were nausea, dizziness, and headache (DPR, 2015a).

5. Air Monitoring Network Sampling Methods and Results

Ambient concentrations of chlorthal-dimethyl are monitored as one of the 37 chemicals included in the AMN. This monitoring takes place in three California communities: Ripon, Salinas, and Shafter. Monitoring locations were selected for inclusion in the AMN after a thorough selection process which included prioritizing communities based on pesticide use, demographic data (including: communities with higher populations of children, persons over 65, and the number of people living in close proximity to agricultural areas with high use of pesticides), and availability of other exposure and health data (Tuli *et al.*, 2015)

One 24-hour air sample was collected every week at each sampling location from February 1, 2011, to December 31, 2014. Sampling for chlorthal-dimethyl was performed using an Airchek HV30 pump (SKC Inc[®] cat#228-030) set to pull air at a rate of 15 L/min through a Teflon[®] cartridge containing 30 mL of XAD-4 sorbent resin material. Sampler flow rates were measured at the start and end of sampling periods with a DryCal[®] flow meter. Sample labels were affixed to the samples and were recorded alongside date, time, location, staff initials, weather conditions, and measured flow rate on the chain of custody (COC). Three types of quality control samples were collected: trip blanks, fortified field spikes, and co-located duplicate samples (DPR, 2011).

Chemical analysis of collected samples was conducted by the California Department of Food and Agriculture Center for Analytical Chemistry (CDFA laboratory). Samples were extracted from the XAD-4 resin using ethyl acetate and were analyzed with gas chromatography-mass spectrometry (GC-MS) and liquid chromatography-mass spectrometry (LC-MS) (DPR, 2008). The method detection limit (MDL), which is the lowest concentration of a pesticide (analyte) that a chemical method can reliably detect, for chlorthal-dimethyl corresponds to a concentration of 1.67 ng/m³. The limit of quantitation (LOQ), defined as the level at which concentrations may be reliably measured and is set at a certain factor above the MDL, is 9.3 ng/m³ (Tuli *et al.*, 2015). Trace detections, which are samples with measured amounts that are higher than the MDL but lower than the established LOQ, were assigned the value halfway between the MDL and the LOQ (Trace= 0.5*(MDL+LOQ), or 5.5 ng/m³). As shown in Table 2, for chlorthal-dimethyl, out of the 613 air samples collected from February 1, 2011, to December 31, 2014, 117 samples contained trace levels and only one sample contained a concentration that was above the LOQ (i.e., a quantifiable detection).

Table 2- Summarized AMN Results for Chlorthal-Dimethyl

	Salinas	Shafter	Ripon
No. Possible Detections	204	204	205
Total no. detections	104	11	3
No. quantified detections	1	0	0
% of possible detections	51.0%	5.4%	1.5%
% of quantifiable detections	0.49%	0%	0%
Highest acute concentration	10.3 ng/m ³	6.9 ng/m ³	6.9 ng/m ³
Highest sub-chronic concentration	6.7 ng/m ³	6.9 ng/m ³	5.8 ng/m ³
Highest chronic concentration	3.9 ng/m ³	5.0 ng/m ³	4.8 ng/m ³

6. Pesticide Use Reporting

Agricultural applicators are required to report use of any registered pesticide to DPR and to the County Agricultural Commissioner presiding over the county in which the application occurred. This data is collected by DPR and stored in the Pesticide Use Report (PUR) database. Information in this database includes, but is not limited to, application date, pounds of AI applied, area treated, formulation applied, and location of the application using meridian, township, range, and section data (DPR, 2011).

The PUR database was queried at distances of 5 miles from the monitoring site at each of the AMN communities. The PUR database provides location information in the form of Public Land Survey System (PLSS) sections. The resolution of this data is 1 mi² per section. The query included PLSS sections if any part of their 1 mi² area fell within a given radius from the AMN sampling station. This data was screened for any use patterns that would suggest any errors; all queried results were of sufficient quality for inclusion. Use information was summed into weekly totals and used to reference against detection patterns. The absence of an adequate number of quantifiable detections prevented correlation of individual reported uses with detections.

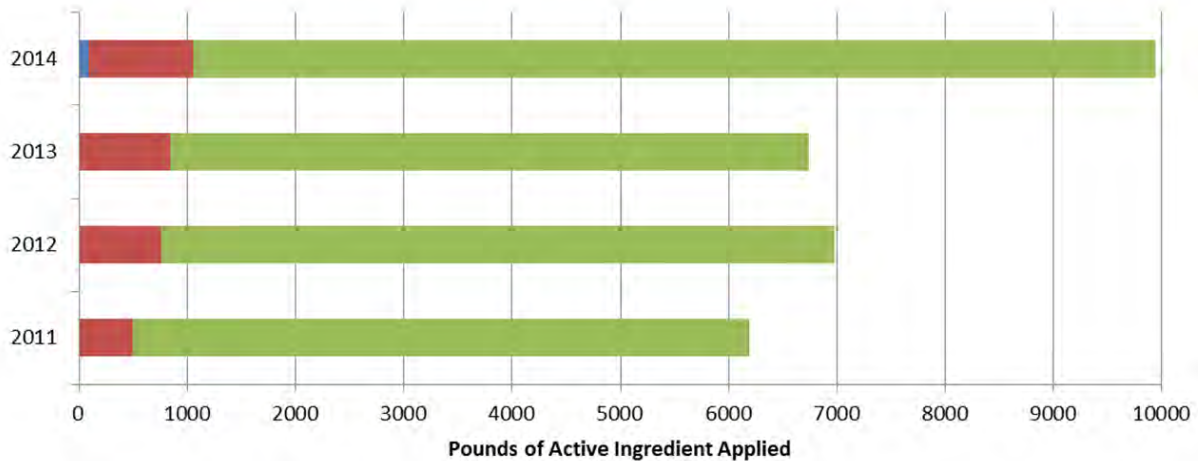

6.1 Data Quality

PUR data is subject to no less than 50 validation processes to mitigate the presence or effect of errors on the quality of data contained therein (DPR, 2014). Additionally, while incorporating the results of the query into our analysis, data was monitored for errors. Reported uses in terms of pounds of AI per acre were checked for any results over a threshold of 110% of the maximum rate allowed by the product label. No such erroneous results were found or eliminated in the case of chlorthal-dimethyl for the returned records.

6.2 Use Profile

Among the monitored communities, the highest reported use of chlorthal-dimethyl was in Salinas, which accounts for 89.4% of the total combined use within 5 miles of all three AMN sampling locations during the 4 years under consideration. Ripon follows with 10.3% of total reported use, and Shafter accounts for only 0.3% of total use. Use in each community remained fairly consistent over the 4 years under consideration, as can be seen in *Figure 2*.

In the 5 miles surrounding Salinas, broccoli accounts for the majority of chlorthal-dimethyl use, with 65% of chlorthal-dimethyl applied, followed by cauliflower and onion (dry, Spanish, white, yellow, red, etc.) at 25% and 7% respectively. Use within the same distance of Ripon is less dominated by a single crop, with collards (24%), leeks (22%), kale (16%), and cabbage (15%) as well as 9 other crops falling below 10% use. These are represented in *Figure 3*. The single use in the 5-mile region around Shafter was on broccoli in 2014.

	2011	2012	2013	2014
Shafter	0	0	0	90
Ripon	499.61	763.3	845.15	964.16
Salinas	5688.48	6217.04	5891.7	8889.12

Figure 2 - Pounds of chlorthal-dimethyl (AI) applied within 5 miles of Salinas, Shafter, and Ripon from February 2011 - December 2014.

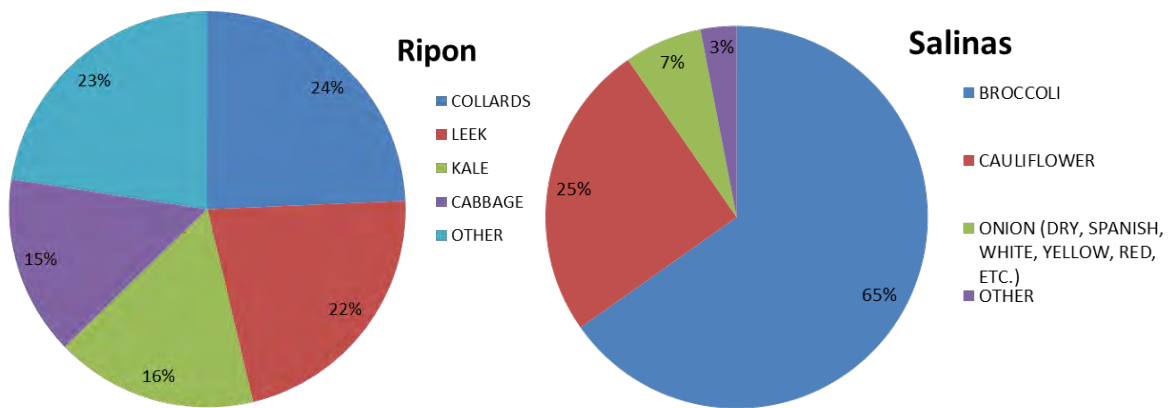

Figure 3 – Chlorthal-dimethyl use within 5 miles of each sampling location, by crop

The majority of use of chlorthal-dimethyl in the region surrounding Salinas was of the flowable herbicide formulation. In the area around Ripon there was significantly less use of chlorthal-dimethyl in general, and all of these applications were of the flowable herbicide formulation. There was only one use of chlorthal-dimethyl around Shafter, and this was of the W-75 formulation. Use by formulation is summarized in *Figure 4*. Application methods were limited to ground application in all cases within 5 miles of the AMN station during the monitoring period with the exception of one aerial application between 4-5 miles of Salinas in October of 2011.

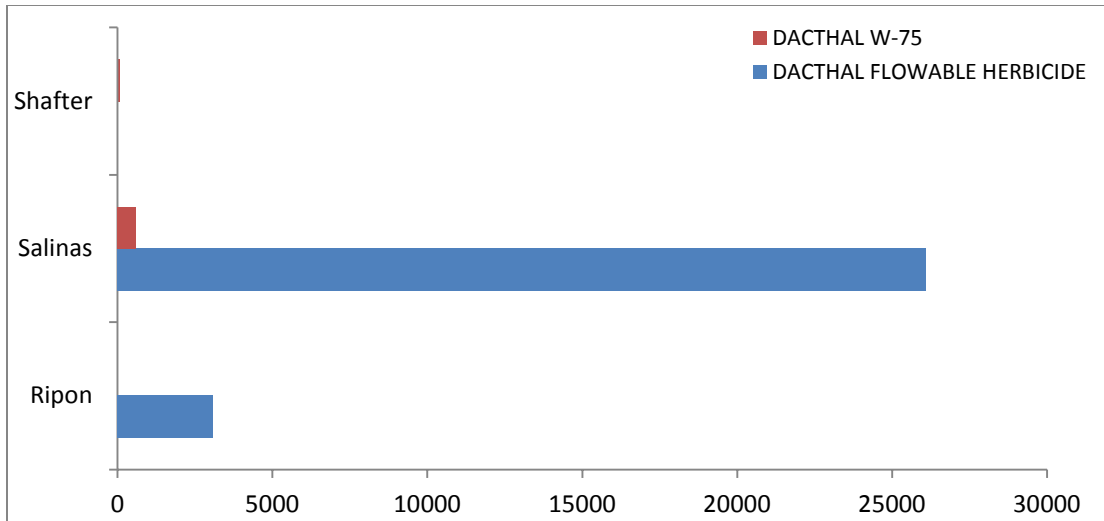

Figure 4 – Use of chlorthal-dimethyl by formulation type (lbs AI; Feb 1, 2011-Dec 31, 2014)

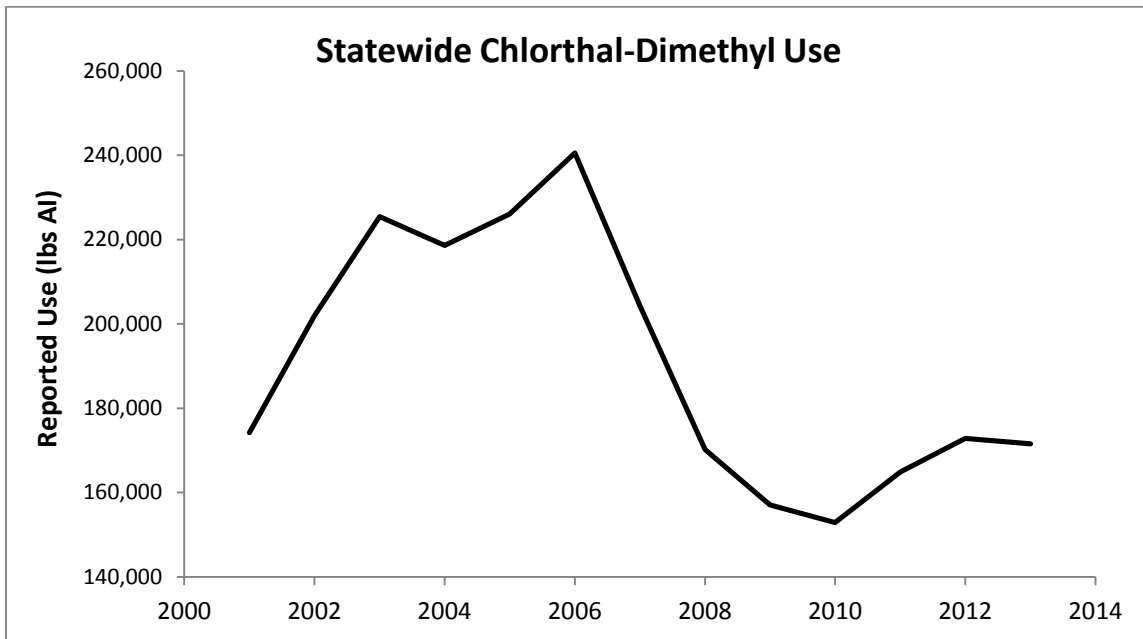

Figure 5 – Statewide use of chlorthal-dimethyl by year

6.3 Spatial Representation of Pesticide Use around Air Monitoring Network Locations and Meteorological Data

Meteorological conditions can play an important role in influencing ambient concentrations of pesticides and in determining the locations to which these pesticides can drift. To facilitate a better understanding of the predominant meteorological conditions at each site, weather data from February 1, 2011, through December 31, 2014, was utilized to create wind roses that were paired with maps of chlorthal-dimethyl use within 5 miles of the AMN sampling locations (Figures 6-8). Wind roses are a graphic tool to view the percentage of time wind speed and

direction are distributed at a particular location. The wind rose shows the frequency of winds blowing *from* a direction over a certain period. The length of each spoke relates to the percentage of time that the wind blows from that direction.

Weather information was obtained from select meteorological stations operated by the Department of Water Resources, as part of the California Irrigation Management Information System (CIMIS). Information at these CIMIS stations is collected hourly and includes wind speed, direction, relative humidity, precipitation, solar radiation, barometric pressure, dew point, and soil temperature (DPR, 2011).

We used CIMIS Station #116 Salinas to provide meteorological information for the Salinas AMN. This station is roughly 6 miles northwest of the Salinas AMN station. The elevation is 61 feet. The surrounding terrain is flat.

We used CIMIS Station #138 Famoso to provide meteorological information for the Shafter AMN. This station is roughly 7 miles northeast of the Shafter AMN station. The elevation is 415 feet. The surrounding terrain is flat. Although CIMIS station #5 Shafter is closer to the Shafter AMN station, the station has a gap in wind direction data of over two years, and could not be used in this analysis. The Famoso site was the next closest CIMIS weather station to the Shafter AMN station.

We used CIMIS Station #71 Modesto to provide meteorological information for the Ripon AMN. This station is roughly 7 miles southwest of the Ripon AMN sampling station. The elevation is 35 feet. The surrounding terrain is flat.

The geographic distribution of chlorthal-dimethyl applications made within 5 miles of the three AMN station was examined. The cumulative use of chlorthal-dimethyl as pounds of active ingredient from February 1, 2011, through December 31, 2014, for each square mile PLSS section was summed and entered into ArcMap® 10.3.1 graphical software.

Salinas was the community with the highest reported use of chlorthal-dimethyl within 5 miles of an AMN station. The sums of use for February 1, 2011, through December 31, 2014, for each PLSS section were below 2,000 pounds of AI for all but 2 sections. These two sections are indicated in red in *Figure 6*. Each of these areas of high use is within an area that may be upwind of both the community and AMN station during predominant meteorological conditions indicated in the wind rose in *Figure 6*.

Shafter and Ripon both reported low chlorthal-dimethyl use between February 1, 2011, through December 31, 2014. There were no applications in Ripon that exceeded 250 lbs of chlorthal-dimethyl for any year queried. There was only one application of chlorthal-dimethyl reported within 5 miles of the AMN station in Shafter and it consisted of only 90 lbs applied.

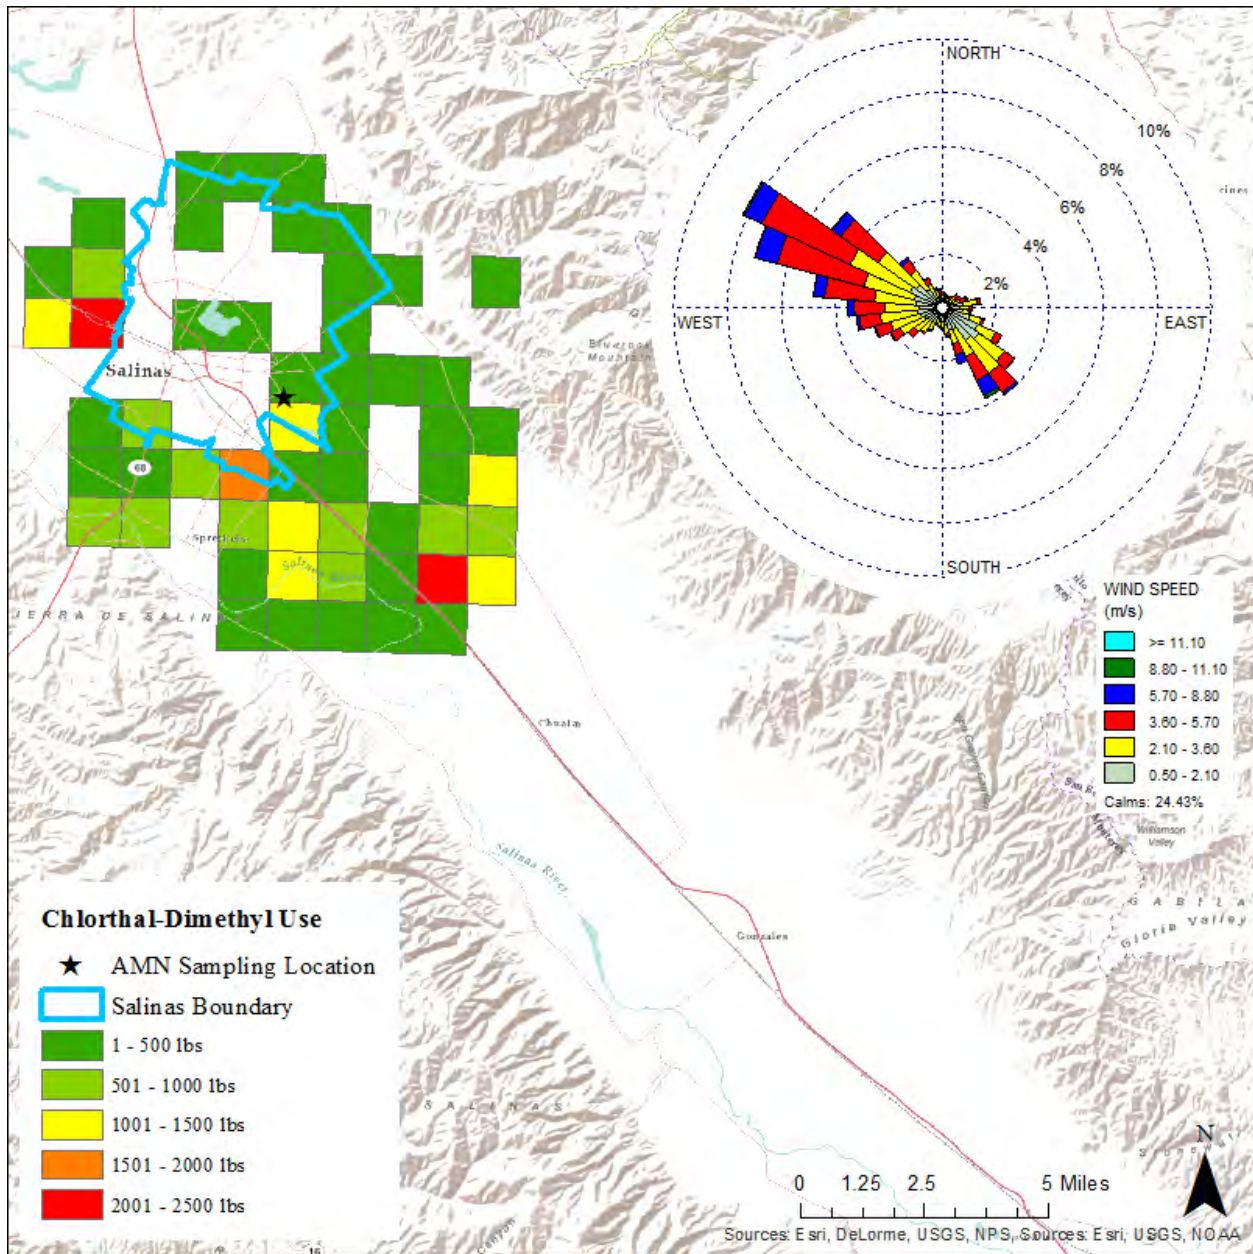

Figure 6 - Salinas: Use within 5 miles of the AMN station and wind roses. Wind flow is FROM the directions shown.

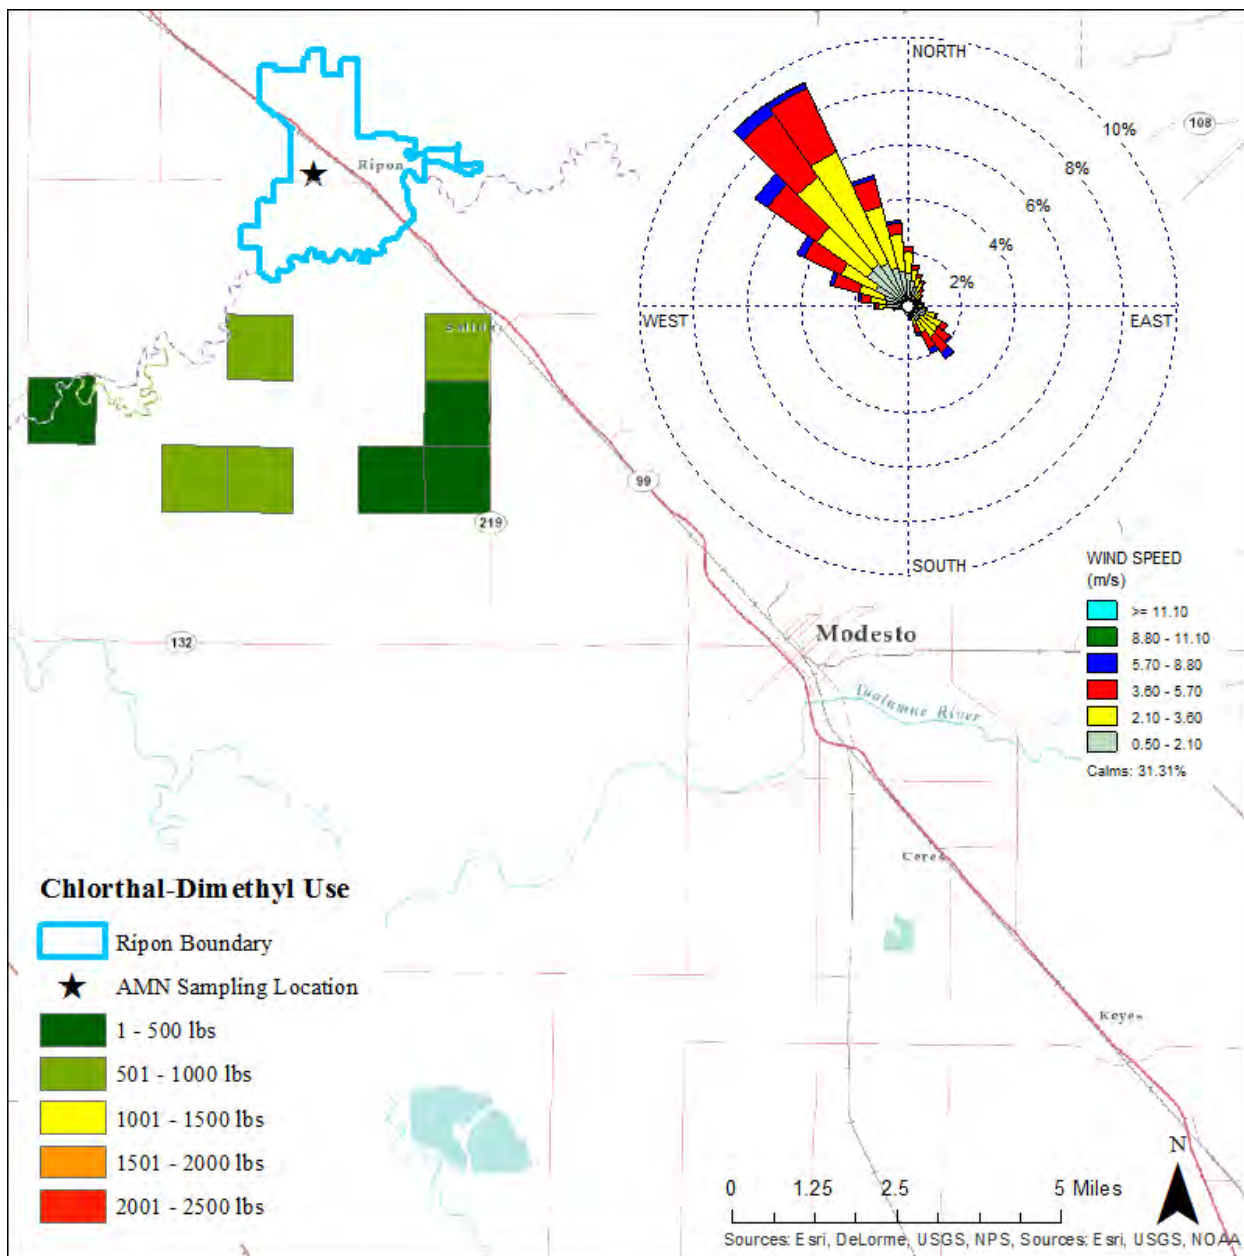

Figure 7 - Ripon: Use within 5 miles of the AMN station and wind roses. Wind flow is FROM the directions shown.

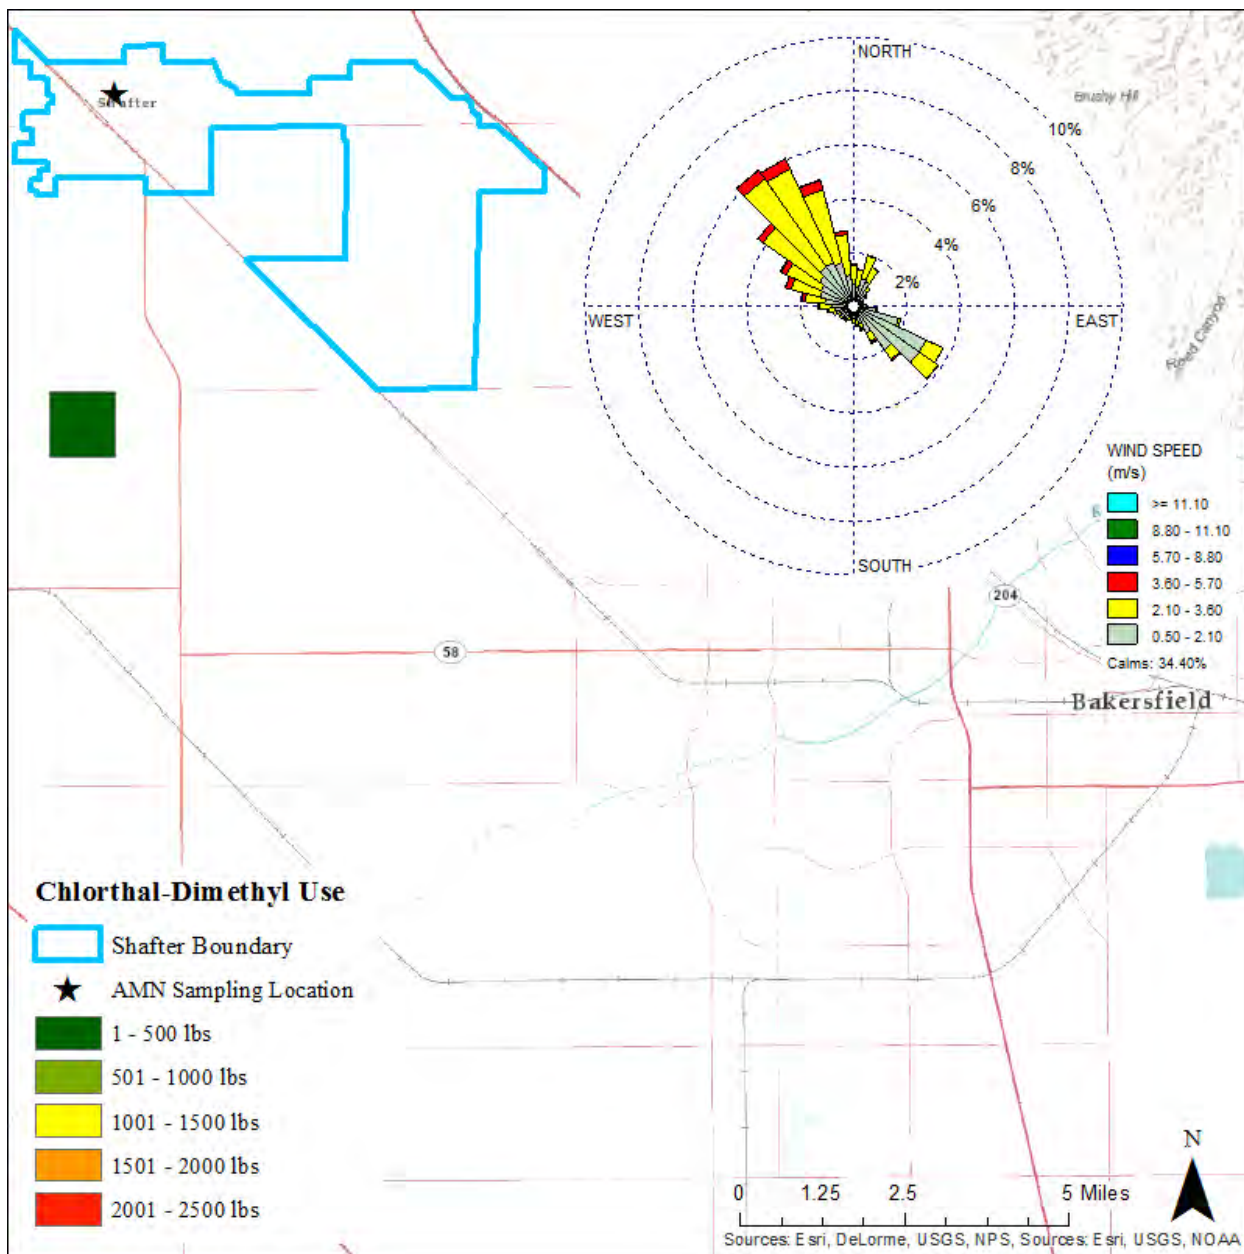

Figure 8 - Shafter: Use within 5 miles of the AMN station and wind roses. Wind flow is FROM the directions shown.

7. Comparison of Air Monitoring Network Measured Results with Reported Pesticide Use around the Sampling Locations

Due to a lack of AMN-measured chlorthal-dimethyl quantifiable concentrations for all three AMN locations (a total of one sample out of 613 samples taken had a quantifiable concentration), a statistical correlation between use and concentrations could not be generated. Of the three communities evaluated, the highest amount of reported use within 5

miles of the sampling location occurred in Salinas. *Figure 9* illustrates the amount of reported use for each week compared to AMN-measured chlorthal-dimethyl concentrations on the given week. Almost all the detections in Salinas were at trace levels. Only one quantifiable concentration was sampled in Salinas (10.3 ng/m³) on a day that bracketed an application of 35 lbs AI (63 lbs Flowable Dacthal) to a 11.6 acre field of broccoli field at 15:30 (DPR, 2015c). This application was within 3 miles southeast and upwind of the monitoring station (*Figure 9*; DPR, 2015c). This application was examined and determined to be consistent with other applications occurring in the region throughout the monitoring in terms of the number of acres, pounds of AI per acre, and application method (DPR, 2015c).

No quantifiable concentrations throughout the four years of AMN monitoring were measured in both Ripon and Shafter, and only 5.4% and 1.5% of all samples collected contained trace detections, respectively. These detections and reported uses are shown in *Figure 10* and *Figure 11*, which represent Ripon and Shafter, respectively. According to these figures, higher use before the sampling dates didn't cause detections in Ripon and Shafter. Traces of chlorthal-dimethyl were detected in some dates on which there was low or no uses.

Reported use of chlorthal-dimethyl was significantly lower than that of other pesticides included as part of the AMN. For example, in Salinas between February 1, 2011, and December 31, 2014, there were only 26,686 lbs of chlorthal-dimethyl applied compared to 3,033,431 lbs of chloropicrin applied within the same period (~113 times the amount of chlorthal-dimethyl). Other AIs monitored for by the AMN around Salinas with use exceeding that of chlorthal-dimethyl included 1,3-dichloropropene, of which 1,386,286 pounds of AI were used, and methyl bromide, of which 904,472 pounds of AI were used. These were 52 and 34 times the amount of chlorthal-dimethyl applied in the same time and area (DPR, 2015c).

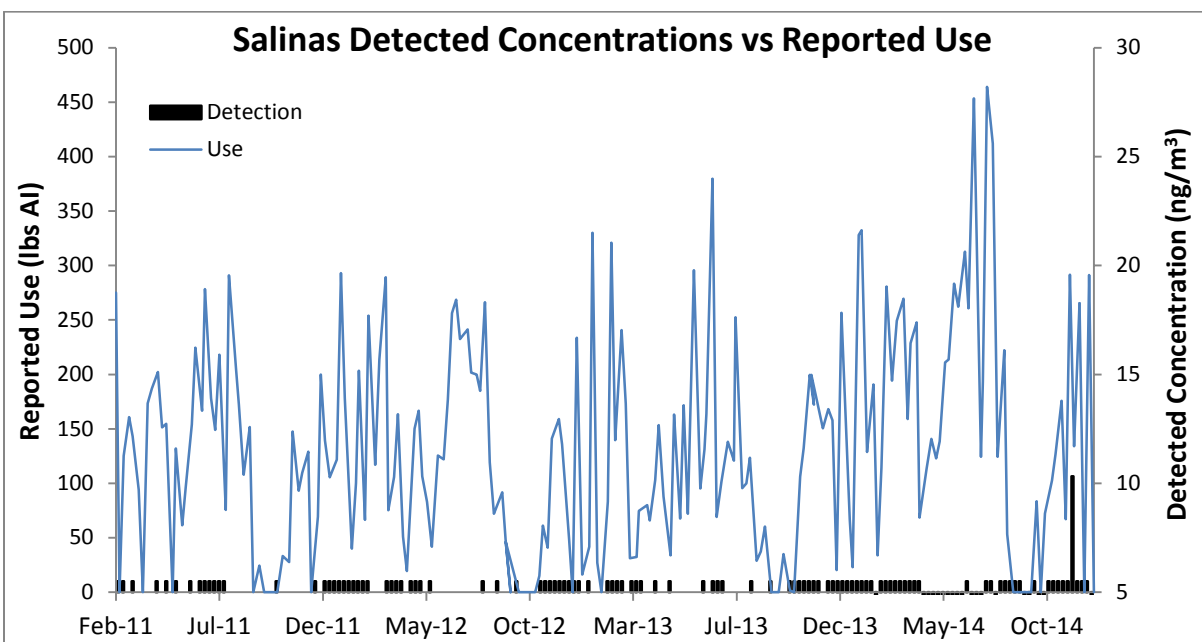

Figure 9 – Comparison of weekly sums of reported use within 5 miles of Salinas to AMN detections between February 1, 2011, and December 31, 2014.

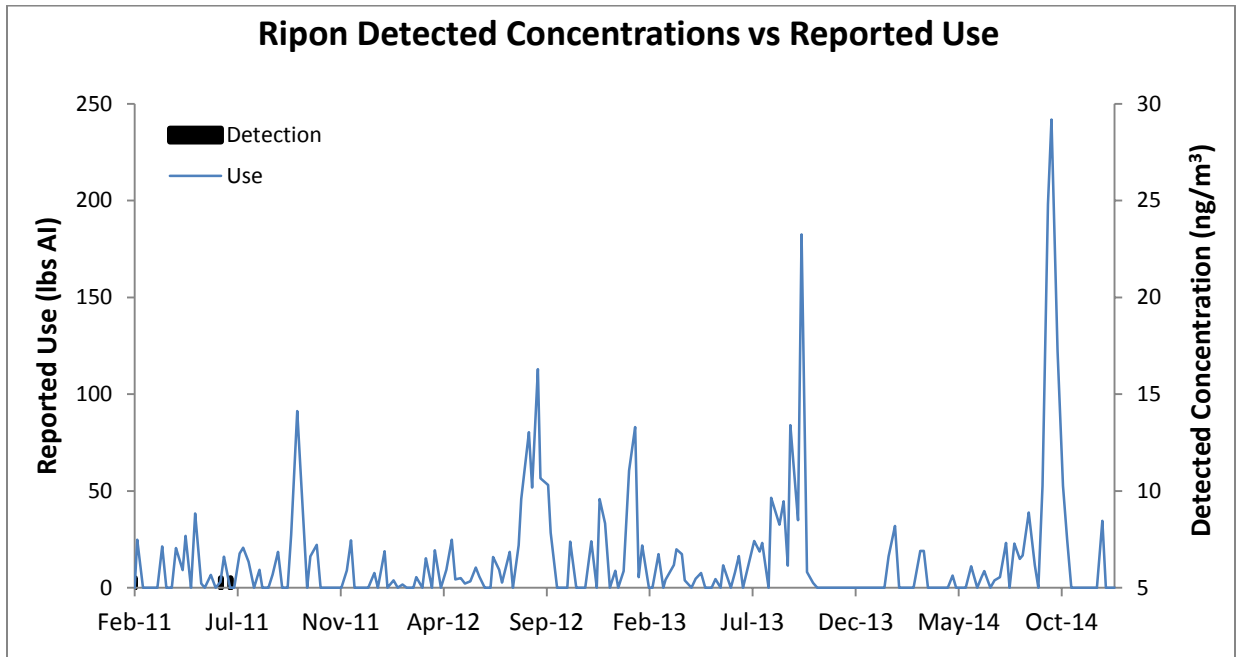

Figure 10 – Comparison of weekly sums of reported use within 5 miles of Ripon to AMN detections between February 1, 2011, and December 31, 2014.

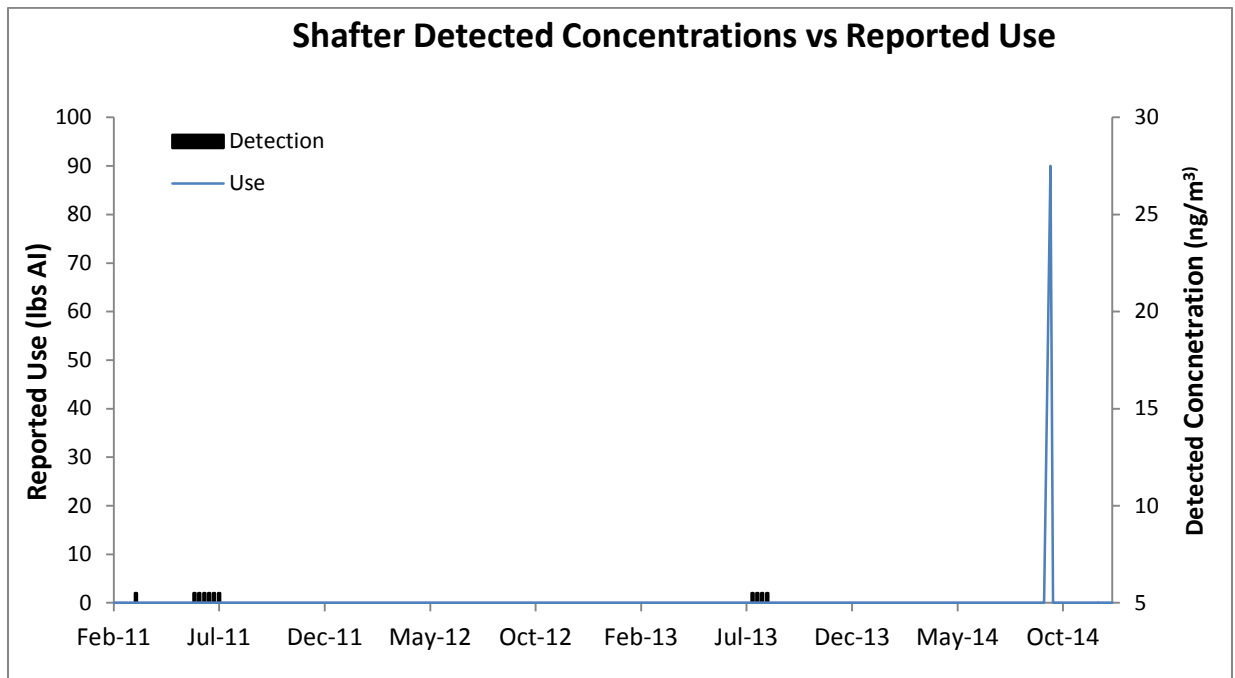

Figure 11 – Comparison of weekly sums of reported use within 5 miles of Shafter to AMN detections between February 1, 2011, and December 31, 2014.

8. Discussion and Conclusions

Only one quantifiable detection of chlorthal-dimethyl was measured from any of the AMN locations between February 1, 2011, and December 31, 2014. All detections, including the sole quantifiable detection, were below their respective screening levels as presented in Tuli *et al.*, 2015. These low levels, as well as variation inherent in non-quantifiable (trace) detections, prevented any statistical analysis of local chlorthal-dimethyl use and ambient chlorthal-dimethyl concentrations.

The low number of detections can be attributed to the low amount of chlorthal-dimethyl applied within 5 miles of the AMN stations. Aside from the low reported use, transport of chlorthal-dimethyl as a vapor or particulate phase can be a direct result of favorable meteorological conditions. This may lead to transport exceeding the 5-mile radius considered within the scope of this report. This may be the explanation for the trace detections noted in Shafter in 2011, despite no reported use within 5 miles of the AMN station during that year.

Overall, the AMN measured ambient concentrations of chlorthal-dimethyl were far below the established health screening levels (DPR, 2011). This held for all communities monitored and for all exposure scenarios evaluated: chronic, sub-chronic, and acute. Furthermore, the lack of sufficient quantifiable chlorthal-dimethyl detections prevented a more thorough statistical analysis to correlate reported use with ambient AMN concentrations.
